

Heritage Sites In-Depth Analysis Using Tableau	 Entice	 Enter	 Engage	 Exit	 Extend
Scenario: Sourcing Global/National Heritage site datasets, cleaning data variables, developing interactive Tableau dashboards, and uncovering key spatial, preservation, and tourism trends.	How does a user discover the analysis project or initiate the exploratory phase?	What is experienced while accessing the dataset and setting up the Tableau workspace?	In the core moments of building worksheets and interactive visual dashboards, what happens?	What does the user or evaluator experience as dashboard storytelling and project reporting conclude?	What happens after the core internship review to scale, host, or future-proof the analytics model?
Steps What does the analyst/user typically experience chronologically?	1. Problem Definition Outlines objectives to analyze regional distribution, risk levels, and historical timelines of heritage sites. 2. Data Sourcing Searches global open data hubs (UNESCO, Kaggle) for robust structured heritage listings.	3. Data Profiling Inspects CSV/Excel data fields for empty geographic coordinates and inconsistent regional naming conventions. 4. Tableau Connection Loads the curated heritage dataset into Tableau Desktop / Public workspace.	5. Map Generation Builds detailed geographic symbol and filled maps plotting global distributions. 6. Trend Discovery Creates advanced bar and area charts tracking heritage threat status over centuries. 7. Dashboard Composing Assembles dynamic filters (Region, Category, Status) into a unified UI layout.	8. Insights Storytelling Configures Tableau Stories to walk evaluators through key analytical conclusions step-by-step. 9. Final Submission Exports comprehensive workbook package along with documentation for evaluations.	10. Public Portfolio Publishes live dashboards on Tableau Public for professional industry visibility. 11. Model Expansion Proposes blending live tourism economic indicators or real-time climate risk data layers next.
Interactions What interactions do they have? • People: Who do they talk to? • Places: Where are they? • Things: What touchpoints?	Research Interfaces UNESCO database portals, Kaggle datasets repository, and internship project briefs. Peer Alignment Consulting core documentation layout requirements.	Preparation Software Microsoft Excel or Python Pandas used for initial rows cleaning. Tableau Interface Data Source configuration tab, relationship mapping canvas, and field casting options.	Tableau Workspace Marks card (Color, Size, Detail), calculated field script editors, and parameter controls. Mentorship Reviews Interacting with technical mentors via slack channels or live query sessions.	Evaluation Portal Project submission dashboard uploading the completed (.twbx) workbook. Presentation Delivery Tableau presentation mode rendering interactive plots directly to project evaluators.	Cloud Hosting Tableau Public Server cloud platform hosting web-embedded visualizations. Professional Media LinkedIn sharing networks showcasing internship micro-credentials and interactive data stories.
Goals & Motivations At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")	"Help me choose a distinct, well-documented heritage dataset so my subsequent metrics stand out during evaluation."	"Help me cleanly parse spatial geo-coordinates to avoid missing data plot holes on maps later."	"Help me craft fluid interactive filter actions so my dashboard answers ad-hoc questions smoothly."	"Help me format presentation paths perfectly so the project evaluation board immediately captures the core takeaways."	"Help me keep my workspace optimized and shareable so external hiring managers can interact with my portfolio directly."
Positive Moments What steps does a typical person find enjoyable, productive, fun, motivating, or exciting?	Uncovering rich metadata parameters including site history, cultural criteria, and endangered alert tags.	Tableau seamlessly recognizes longitudes/latitudes and instantly populates the geographical background map.	Connecting action filters successfully updates all peripheral metric sheets at lightning speeds.	Successfully generating clear visual evidence detailing exactly which continents have the highest density of at-risk properties.	Receiving positive structural feedback and badge verification from data analytics reviewers.
Negative Moments What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Encountering truncated regional text strings in free heritage records online.	Manually correcting structural date variations of ancient site founding years across columns.	Managing dense color distributions or overlapping data points when plotting thousands of site markers simultaneously.	File sizes expanding heavily when embedding rich historical image references locally into tooltip frames.	Navigating layout alignment adjustments between desktop application builds and cloud-hosted render screens.
Areas of Opportunity How might we make each step better? What ideas do we have? What have others suggested?	Build uniform data access pathways by connecting directly to live-updating UNESCO web APIs instead of static exports.	Utilize automated custom data grouping algorithms within Tableau to seamlessly resolve slight country naming deviations.	Integrate customized dynamic parameters allowing users to toggle color palettes dynamically based on selection tiers.	Leverage native tooltips optimization tricks to minimize layout processing lags when scaling user query metrics.	Establish routine version maintenance checks to guarantee full layout compatibility with future analytical platform upgrades.
